New isolated Corynebacterium glutamicum nucleic acid encoding a metabolism and oxidative phosphorylation protein for production modulation of production of fine chemicals e.g. amino acids, modulation of production carbohydrates or enzymes Ö,

Claim 3; Page 274-275; 1246pp; English.

CC energy production. The C. glutamicum SMP gene can be used in vectors (II) for expression in host cells and production or modulation of corporation of fine chemicals, such as, an organic acid, a proteinogenic corporation of the production of the production of the proteinogenic amino acid (preferred), a purine or pyrimidine base, a nucleoside, a nucleotide, a lipid, a saturated or unsaturated fatty control of a carbohydrate, an aromatic compound, a vitamin, a carbohydrate, an aromatic compound, a vitamin, a confector, a polyketide, or an enzyme. The presence of (I) or SMP proteins (II) encoded by them are used for diagnosing the presence or activity of corganization of them are used to map genomes of organization related to containing them are used to map genomes of organizations required to containing them are used to map genomes of organizations required in evolutionary studies, in determining SMP protein regions required for function, in modulating SMP protein activity, in modulating the metabolism of sugars, and in modulating high-energy molecule production coin a cell (i.e. ATP, NADPH). metabolism and oxidative phosphorylation (SMP) proteins given in AAB79243 to AAB 79633 which are involved in carbon metabolism and AAF71360 to AAF71750 encode the Corynebacterium glutamicum sugar

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to the preparation of L-amino acids comprising fermenting L-amino acid-producing coryneform bacteria which overexpresses a gene e.g. that for transketolase, tkt. Also included are transformed coryneform microorganisms harbouring the plasmid pEC-T18mob2 which contains the tkt gene. The method is useful for the fermentative preparation of L-amino acids, i.e. L-lysine, L-threonine and L-isoleucine, in which at least the tkt gene is amplified. L-lysine, L-threonine and L-isoleucine are useful in animal nutrition, in human medicine and in the pharmaceuticals industry. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        is a fragment of the gene for pyruvate oxidase, poxB, which was used to eliminate the poxB gene by insertional mutagenesis in a strain expressing with tkt in order to further increase yields of L-amino acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            C. glutamicum pyruvate oxidase, poxB, mutagenic fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAS15848;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        fermenting coryneform bacteria, comprising fermenting the L-amino acid producing bacteria in which at least the glucose 6-phosphate dehydrogenase (zwf) gene is amplified, and concentrating and isolating the L-amino acid produced. The L-amino acids produced are used in animal nutrition, human medicine, foodstuffs industry and the pharmaceuticals industry. The present sequence is the PCR product of Corynebacterium glutamicum strain ASO19 pyruvate oxidase (poxB) internal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Preparing L-amino acids by fermenting coryneform bacteria transformed with the glucose 6-phosphate dehydrogenase gene is particularly useful to produce L-lysine and L-threonine

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Qy
                                                                                                                                                                                                             Matches 875;
                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is a fragment of the poxB gene of Corynebacterium glutamicum. The poxB gene encodes a pyruvate oxidase enzyme. The poxB gene and the gnd gene encodes a pyruvate oxidase enzyme. The for use in the course of the invention. The gnd gene encodes a phosphogluconate dehydrogenase enzyme. The specification describes a method for the fermentative preparation of L-amino acids, in particular L-lysine, L-threonine, and L-tryptophan. The method comprises fermenting coryneform bacteria in which at least the gnd gene is amplified and overexpressed. The L-amino acids produced are used in animal nutrition, human medicine and the pharmaceuticals industry.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Preparing L-amino acids by fermenting coryneform bacteria transformed with the 6-phosphogluconate dehydrogenase gene is particularly useful to produce L-lysine and L-threonine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              gnd gene; 6-phosphogluconate dehydrogenase; L-amino acid; L-lysine;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Corynebacterium glutamicum.

The poxB gene can be used for fermentative production of L-amino acids, specifically L-lysine, which is used in human medicine, foods and especially animal nutrition. (I) is also useful as a source of probes and primers for isolation of related sequences. Cells in which the poxB gene is suppressed produce higher yields of L-amino acids. This sequence encodes a fragment of the pyruvate oxidase (E.C. 1.2.2.) poxB gene from corynebacterium glutamicum ATCC13032 found in plasmid pCR2.1-Topo which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 875 BP; 190 A; 193 C; 266 G; 226 T; 0 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Qy
                                              The invention relates to the fermentative production of D-pantothenic acid (I) by growing a (I)-producing coryneform bacterium in which the activity of at least the sequence poxB (ABL58754, ABL58755) encoding pyruvate oxidase (ABB58755, EC 1.2.2.2) has been weakened, especially switched off. (I) is then recovered from medium or cells. (I) is a vitamin useful in human medicine, the pharmaceutical and food industries and particularly in animal nutrition. Reducing the activity of poxB improves fermentative production of (I). The present sequence is that of a polynucleotide fragment of the poxB gene, useful in examples of the
                                                                                                                                                                                                                                      Example 3; Page 16; 28pp; German.
                                                                                                                                                                                                                                                                           pyruvate oxidase gene
                                                                                                                                                                                                                                                                                           Fermentative production of D-pantothenic acid (I), useful e.g. in animal nutrition, from coryneform bacteria with reduced activity of
                                                                                                                                                                                                                                                                                                                                                   WPI; 2002-363950/40

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
